

Quickly pay for themselves

Defender performance is the result of the superiority of the Defender seal, the insulating values of the Defender materials and the dead air space they combine to create. Defender windows often pay for themselves within one to two years, compared to eight to ten years for exterior storm windows.

Besides controlling energy losses and drafts year-round, Defender window systems also reduce noise and pollen. And they also add to the

security of a building.

Attach to any window

Defender makes a system for every window. You can use magnetically mounted system where you need easily removable windows, or you can specify Super-Lock Systems for large windows areas or where added security is needed.

Defender materials are supplied in lengths from which the sizes you need easily cut by contractors on the job site or it can be an easy do it your

self-project. Acrylic window sheets can be cut on-site or by the distributor (often the same source for Defender materials).

Mounting systems are available for either inside or outside the jamb. They are mounted from solid vinyl (PVC), are no more than 3/4" wide, and come in white or brown to coordinate with practically any window jamb color. Custom colors are also available. In place, they are practically invisible.
